## Abstracts

According to our (Global Info Research) latest study, the global Dementia Diagnosis App market size was valued at US\$ 1157 million in 2025 and is forecast to a readjusted size of US\$ 1528 million by 2032 with a CAGR of 4.1% during review period.

A Dementia Diagnosis App is a mobile application designed to assist healthcare professionals in diagnosing dementia by assessing cognitive function, memory, and other related symptoms. These apps often include various screening tests and assessment tools to help detect early signs of dementia and provide a preliminary evaluation before further clinical examination.

Dementia, a neurodegenerative disorder characterized by cognitive decline, poses a significant global health challenge. With the aging of the global population, the number of dementia patients is on the rise. Dementia diagnosis apps have emerged as a convenient and potentially cost-effective tool in the early detection and management of dementia. These apps use a variety of methods, such as cognitive function assessment, symptom tracking, and biomarker analysis (in some advanced cases), to assist healthcare professionals, patients, and their families in the diagnostic process.

In recent years, the market for dementia diagnosis apps has seen steady growth. This growth can be attributed to several factors. Technological advancements in mobile health (m-health) technology are making these apps more accurate and user-friendly. Additionally, rising awareness about the importance of early dementia diagnosis among the general public and healthcare providers is also fueling the demand. For instance, as more research emphasizes that early intervention can slow down the progression of dementia, both patients and doctors are more willing to use these apps for early

screening.

North America currently dominates the global dementia diagnosis app market. The region's strong position is due to several factors. There is a high awareness of dementia and its consequences among the population. Also, the healthcare infrastructure in North America is well - developed, with a high penetration of smartphones and digital health services. Moreover, government initiatives and funding for dementia research and treatment support the growth of such apps in the region.

Europe is another significant market for dementia diagnosis apps. Similar to North America, Europe has an aging population, with a high prevalence of dementia. Countries like the United Kingdom, Germany, and France have well - established healthcare systems that are increasingly open to digital innovation. The European Union has also been promoting digital health initiatives, which has led to the development and adoption of more dementia diagnosis apps in the region. Additionally, strong research and development capabilities in European pharmaceutical and technology companies contribute to the innovation and improvement of these apps.

The Asia - Pacific region is expected to be the fastest - growing market for dementia diagnosis apps in the coming years. The region has a large and rapidly aging population. For example, China is the country with the largest number of dementia patients globally, with over 13 million cases in 2019. As the middle - class population in Asia - Pacific grows, there is an increasing demand for better healthcare services, including digital solutions for dementia diagnosis. Also, the rising penetration of smartphones and the development of local technology companies in countries like India and South Korea are driving the growth of the app market in this region.

In Latin America, countries such as Brazil and Mexico are seeing an increase in the adoption of digital health solutions, including dementia diagnosis apps, due to growing awareness and improving healthcare infrastructure. In the Middle East, some wealthy countries are investing in advanced healthcare technologies, which may boost the market for these apps. However, in Africa, despite a large population, the market for dementia diagnosis apps is still in its infancy, mainly due to limited healthcare access.
