Abstracts

Demineralization is a water treatment technique that removes impurities such as calcium, silica, iron, and magnesium from water. The demineralization plant consists of two beds of chemically treated resin beads that operate in series. Water purification is a process that alters used or polluted water to its natural state, making it suitable for several applications in various fields.

According to our (Global Info Research) latest study, the global Demineralization Plants market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Lead-acid batteries are extensively used in the automotive industry across the globe since they have been designed to maximize current paths and lower internal resistance. The growing automotive market and the rising demand for lead-acid batteries, is increasing the need for recycling these batteries. This, in turn, will increase the need for pure water that is achieved through demineralization process.
