Abstracts

According to our (Global Info Research) latest study, the global Demineralized Allografts market size was valued at US\$ 966 million in 2024 and is forecast to a readjusted size of USD 1527 million by 2031 with a CAGR of 6.8% during review period.

Demineralized Allografts is tissue harvested from one individual and implanted into another of the same species. In a search for an adequate substitute for autogenous bone, cadaveric allograft has been a viable option. Structural and morselized forms are available and prepared as either fresh-frozen or freeze-dried. These grafts provide a structural framework or scaffold for host tissue to grow, hence making allograft osteoconductive. Conversely, its osteoinductive properties are mediocre at best. Upon implantation, the host is expected to experience an intricate immune response. Freezing or freeze-drying the allograft is crucial in minimizing this reaction; however, the fundamental properties of the material may be altered.

Medtronic, J & J (DePuy Synthes) and Zimmer are the leaders of the Demineralized Allografts industry, which take about 80% market share. North America is the major region of the global market, which takes about 90% market share.
