Abstracts

Demineralized bone matrix (DBM) is an allograft bone from which the inorganic mineral is removed and leaves behind collagen (structural protein) matrix. The removal of the bone mineral further results in exposing more biologically active bone morphogenetic proteins (growth factors). Scope of the Report:

This report focuses on the Demineralized Bone Matrix in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. Further, demineralized bone matrix is used to extend and bolster the bone graft. This is due to the ability of growth factors to control the differentiation of progenitor cells, which are responsible for bone and cartilage formation.

The worldwide market for Demineralized Bone Matrix is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
