Abstracts

The global Demineralized Bone Matrix and Demineralized Allograft market size is expected to reach \$ 890.3 million by 2029, rising at a market growth of 6.4% CAGR during the forecast period (2023-2029).

Demineralized bone matrix (DBM) is allograft bone that has had the inorganic mineral removed, leaving behind the organic 'collagen' matrix. It was first discovered by Marshall Urist in 1965 that the removal of the bone mineral exposes more biologically active bone morphogenetic proteins. These growth factors modulate the differentiation of progenitor cells into osteoprogenitor cells, which are responsible for bone and cartilage formation. As a result of the demineralization process, DBM is more biologically active than undemineralized bone grafts; conversely the mechanical properties are significantly diminished.

This report studies the global Demineralized Bone Matrix and Demineralized Allograft production, demand, key manufacturers, and key regions.
