According to our (Global Info Research) latest study, the global Dengue NS1 ELISA Kits market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Dengue NS1 ELISA Kits are diagnostic tools used for the detection and quantification of the Dengue virus non-structural protein 1 (NS1) in patient samples. The NS1 protein is present in the blood of individuals infected with the Dengue virus and can be detected as early as the first day of symptoms. These ELISA kits utilize specific antigen-antibody reactions to detect the presence of NS1, aiding in the diagnosis of Dengue fever. They typically include pre-coated microplates, NS1 antigen, detection antibodies, and necessary reagents.

The industry trend for Dengue NS1 ELISA Kits is increasing due to the rise in the number of Dengue cases globally, particularly in tropical and subtropical regions. The need for rapid and accurate diagnosis of Dengue fever to implement timely treatment and control measures is driving the demand for these ELISA kits. Additionally, research and development efforts to improve the sensitivity and specificity of the kits and the development of vaccines are expected to positively impact the industry trend. However, the availability of alternative diagnostic methods and the implementation of vector control programs may influence the industry dynamics.
