Abstracts

The dust content in the cement kiln tail gas is extremely high, up to 80-120mg/Nm³; at the same time, the particle size of fly ash is small, resulting in high viscosity and strong adhesion of the dust, which is easily adsorbed on the surface of the catalyst; cement kiln dust contains a large amount of Ca components and a small amount of K Na and other alkali metals, these substances will poison the active sites on the surface of the catalyst and deactivate the catalyst. Poison ability.
