The original flue gas temperature in the iron and steel industry is low, generally at 120-150°C; the SO₂ concentration is high, and the SO₂ concentration in the flue gas is generally 1000-1500mg/m³, and some can reach 3000-5000mg/m³; the moisture content is high, which can reach 10% to 16%; Dust is highly viscous under high humidity and high sulfur conditions, which can easily cause catalyst blockage; the dust composition is complex, containing various alkali/alkaline earth metal components such as K₂O, Na₂O, and ZnO. The denitrification catalyst in the iron and steel industry meets the denitrification performance at low temperature, and needs to have high anti-alkali, high anti-sulfur and other anti-poisoning capabilities.
