A Denitrification Spray Lance is a specialized device used in industrial processes to reduce nitrogen oxide (NOx) emissions through a process called denitrification or selective non-catalytic reduction (SNCR). It operates by injecting a reducing agent, such as ammonia or urea, into high-temperature flue gases, typically in power plants, waste incinerators, or other combustion systems. The spray lance is designed to precisely distribute the reducing agent into the gas stream, where it reacts with nitrogen oxides to form harmless nitrogen (N₂) and water vapor, significantly reducing NOx emissions. This technology helps industries meet environmental regulations and improve air quality by lowering the emission of harmful pollutants.
