Denitrification spray nozzles are specialized devices used in industrial processes to reduce nitrogen oxide (NOx) emissions by facilitating the denitrification process. These nozzles spray a controlled amount of liquid, typically a reagent such as ammonia or urea, into exhaust gases in boilers, furnaces, or power plants. The liquid reacts with nitrogen oxides in the exhaust, converting them into harmless nitrogen and water vapor, thereby reducing air pollution and meeting environmental regulations. The design of these nozzles ensures efficient atomization of the liquid, allowing for precise distribution and optimal contact with the exhaust gases, enhancing the effectiveness of NOx reduction. Denitrification spray nozzles are critical components in Selective Non-Catalytic Reduction (SNCR) and Selective Catalytic Reduction (SCR) systems used for emission control.
