Abstracts

The global Dental 3D Printing Resin market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Dental 3D resins are resins specially formulated for 3D printer dental applications. It is a photopolymer resin that cures through a light curing process and forms precise, detailed dental models or prototypes. Dental 3D resins are designed to meet the specific requirements of dental applications, including biocompatibility, accurate reproduction of intricate details and durability. They are generally safe for use in the oral cavity and are formulated to be compatible with dental materials and processes. These resins are used to create a variety of dental products, including orthodontic treatment plan models, surgical guides, crown and bridge models, denture frames and other dental restorations. Dental 3D resins are often used with digital dental scanners and 3D printers using technologies such as stereolithography (SLA) or digital light processing (DLP). These 3D printers use light sources such as lasers or projectors to selectively cure resin layer by layer to create the desired 3D object. Overall, dental 3D resins enable dentists and dental laboratories to create precise and accurate dental models and restorations, streamlining dental workflow and improving patient outcomes.
