Abstracts

The global Dental Alginate Powder Impression Material market size is expected to reach $ 666 million by 2032, rising at a market growth of 5.9% CAGR during the forecast period (2026-2032).

Alginate is one of the commonly used dental material. Dental Alginate Powder Impression Materials are used to capture a range of dental impressions because when properly used they provide highly detailed impressions. However, because the material does not often provide lasting dimensional stability, alginate impressions must be used to create a model or temporary restoration quickly after the impression is captured. Alginates are packaged in a powdered form and must be mixed before an impression is captured. This makes the product economical and easy to store in a practice. Different alginates offering different working times and other physical properties, so it is important to find a material that is both comfortable to work with and capable of capturing the details required for high-quality dental work.

In 2025, global Dental Alginate Powder Impression Material sales reached approximately 86,930 k units , with an average global market price of around US$ 5 per unit.

Global key manufacturers of Dental Alginate Powder Impression Material include Dentsply Sirona, GC Corporation, Septodont, and others. The top three producers together hold more than 50% of the market share, with the largest producer being Dentsply Sirona at 30%. The global origins are mainly located in North America, Europe, China and Japan. In terms of applications, dental clinics are the top application area with a market share of 46%, followed by hospitals with a 37% share.
