According to our (Global Info Research) latest study, the global Dental Caries market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The scientific term dental caries is known for the tooth decay or cavities. Tooth decays are generally caused by the specific endogenous bacteria such as *Streptococcus mutans* and *Streptococcus sobrinus*. It occurs by the production of acid that later destroys the layer and enamel of the tooth. The bacteria continues to grow to produce acid that gets into the inner layer of the tooth if the decay is not removed on time. In the U.S, approximately 90% of young adults have dental caries, while out of all dentate adults approximately 94% suffer from coronal caries. According to the estimation of WHO, on a global basis, 200,335,280 teeth were either decayed, filled or missing among just that age group.

Factors contributing in the growth of Dental Caries Market are increased proportion of sugar based medication and existing life style factors. Additionally the increasing population in the Asia Pacific region is also the major factor to drive the growth of global dental caries market. However, according to WHO, it was observed that the cases with dental caries are declining due to the number of public health measures and improved self-care practices in the developed countries. These are the major restraints for the dental caries market. The increase in caries commonly occurs in the children, lower socio economic group and the new immigrants.
