Abstracts

The global Dental Digital Treatment Software market size is expected to reach \$ 2195 million by 2032, rising at a market growth of 8.6% CAGR during the forecast period (2026-2032).

Dental Digital Treatment Software utilizes computer-aided design (CAD) and computer-aided manufacturing (CAM) technologies, integrating functions such as intraoral scanning, data acquisition, 3D modeling, treatment plan simulation, and intelligent manufacturing. It enables digital management of the entire process from diagnosis and treatment planning to prosthesis fabrication, significantly improving the accuracy, efficiency, and patient experience of dental treatment.

The core driving force behind the development of digital dental treatment software stems from the combined effect of multiple factors: the high incidence of oral diseases globally and the complex restorative needs brought about by an aging society constitute a solid market foundation; simultaneously, the popularization of hardware technologies such as intraoral scanning, CBCT, and 3D printing has created indispensable data input and implementation methods for software applications; furthermore, the integration of artificial intelligence and machine learning technologies is driving the evolution of the software from an auxiliary design tool to a 'super assistant' with automated diagnostic and intelligent planning capabilities, significantly improving the accuracy and efficiency of diagnosis and treatment.
