## Abstracts

A dental fitting is an intraoral (inside the mouth) prosthesis used to restore (reconstruct) intraoral defects such as missing teeth, missing parts of teeth, and missing soft or hard structures of the jaw and palate. Prostheses are used to rehabilitate mastication (chewing), improve aesthetics, and aid speech. A dental fitting may be held in place by connecting to teeth, by suction, or by being held passively by surrounding muscles. Like other types of prostheses, they can either be fixed permanently or removable; fixed prosthodontics and removable dentures are made in many variations.
