Dental implant healing cap is a medical device commonly used in oral implant surgery, usually made of metal or plastic materials. It is used to temporarily fill the cavity above the implant after oral implant surgery to promote the healing of oral tissue and the shaping of soft tissue around the implant. In implant surgery, when the implant is successfully inserted into the oral bone tissue, the doctor will install an implant healing cap on the implant. The healing cap is a screw cap-like device that is threaded onto the implant to create a flat surface on top of the implant. This flat surface helps the surrounding soft tissue to heal better and prepares it for future permanent restorations such as crowns.
