Abstracts

Dental Radiography Systems refers to the imaging equipment which use the radiography principle and used in the dental field. Dental Radiographs are commonly called x-rays. Dentists use radiographs for many reasons: to find hidden dental structures, malignant or benign masses, bone loss, and cavities. A radiographic image is formed by a controlled burst of X-ray radiation which penetrates oral structures at different levels, depending on varying anatomical densities, before striking the film or sensor. Teeth appear lighter because less radiation penetrates them to reach the film. Dental caries, infections and other changes in the bone density, and the periodontal ligament, appear darker because X-rays readily penetrate these less dense structures. Dental restorations (fillings, crowns) may appear lighter or darker, depending on the density of the material. In this report, Dental Radiography System includes Ordinary Radiography Systems, Panoramic Radiography Systems and Cone-beam computed tomography systems (CBCT).
