Depression monitoring wearable devices are an important innovation in the field of mental health in recent years. They provide strong support for the early identification, diagnosis and efficacy monitoring of depression by monitoring the user's physiological and behavioral data in real time. Depression monitoring wearable devices mainly use sensor technology to capture the user's physiological indicators and behavioral data, such as heart rate, heart rate variability (HRV), skin electrodermal activity, body temperature, number of steps, sleep quality, social interaction, etc. These data are transmitted to smartphones or cloud platforms in real time for analysis and processing via wireless transmission methods such as Bluetooth or Wi-Fi. Using artificial intelligence algorithms, the device can identify abnormal patterns related to depression, thereby providing users with early warnings or suggestions.
