## Abstracts

A depth filter for biopharmaceutical applications is a filtration system designed to remove impurities and particles from liquids such as pharmaceutical solutions, vaccines, and biologics. Unlike membrane filters, which operate on a surface filtration mechanism, depth filters utilize a porous matrix structure to trap contaminants throughout the depth of the filter medium. This structure allows for a higher loading capacity and longer service life compared to membrane filters, making depth filters well-suited for applications requiring high throughput and efficient removal of particulates, colloids, and cellular debris. Depth filters are commonly used in biopharmaceutical manufacturing processes for clarification, pre-filtration, and polishing steps to ensure product quality.
