Abstracts

Dermatophytic onychomycosis is a fungal infection of the nail plate, nail bed, and, in some cases, the skin surrounding the nail plate. It is caused by yeast, dermatophytes, and molds; dermatophytes account for 90% of all cases. The fungus, especially *Trichophyton rubrum*, *Trichophyton mentagrophytes*, and *Epidermophyton floccosum*, infects the skin, hair, or nails. It is often perceived by people to be an active and contagious infection. Onychomycosis may persist or worsen if not treated. The fungi that cause onychomycosis exist in common sites such as floors, soil, socks, and shoes. Therapies for onychomycosis include debridement and drugs. Debridement is time consuming and minimally effective in eradicating the fungal infection. Systemic drug treatment is most effective in treating onychomycosis.

According to our (Global Info Research) latest study, the global Dermatophytic Onychomycosis market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Factors such as the rising prevalence of dermatophytic onychomycosis, heavy investments to develop therapies, and frequent product innovations will aid in the steady growth of this market during the forecast period. An important factor that will impel the prospects for growth in this market is the augmented focus on combination therapies. Recently, it has been observed that a combination of topical and systemic treatment increases the cure rate when compared to individual therapies. Since combination therapies have improved clinical efficiency and are more cost-effective than terbinafine, they are increasingly being preferred over individual terbinafine-based therapies as they

have a higher cure rate.
