According to our (Global Info Research) latest study, the global Desalination Pressure Exchangers market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Desalination Pressure Exchangers (PX) are energy recovery devices used in desalination processes to improve the overall energy efficiency of the system. These devices play a critical role in reducing the energy consumption of desalination plants that use high-pressure processes, such as reverse osmosis (RO) or nanofiltration, to produce fresh water from seawater or brackish water.

In a desalination process like reverse osmosis, water is pushed through a semipermeable membrane under high pressure to separate salts and impurities. The high-pressure brine stream that is produced as a result of this process is usually considered waste and discharged. Desalination pressure exchangers are designed to recover the pressure energy from this concentrated brine stream and utilize it to help pressurize the incoming feed water.

Desalination pressure exchangers are an integral part of energy-efficient desalination systems, as they contribute to making the process more sustainable and economically viable, especially in regions where energy costs are high or energy availability is limited. These devices are one of several types of energy recovery devices used in desalination, each with its specific mechanism for harnessing and utilizing the wasted energy in the brine stream.
