The desktop hollow fiber ultrafiltration system is a miniaturized device for water treatment that uses hollow fiber membrane technology for filtration. The system filters water samples through a set of hollow fiber membrane pipes, where the pore size of the membrane is usually 0.01 to 0.1 microns, which can effectively remove suspended matter, bacteria, viruses, large molecular organic matter and some heavy metal ions in the water. The desktop design is usually suitable for laboratory, scientific research, medical and small-scale water treatment applications. It has the characteristics of small size, simple operation and easy maintenance, and can provide efficient and accurate water purification.
