## Abstracts

The global Desulfurization and Denitrification market size is expected to reach \$ 9657 million by 2032, rising at a market growth of 2.2% CAGR during the forecast period (2026-2032).

In 2024, global Desulfurization and Denitrification reached approximately 4 million units, with an average global market price of around US\$ 2000 per unit. Desulfurization and Denitrification is after floating ash in flue gas is roughly removed in the dry type electrostatic precipitator, the gas flows through the GGH extractor to be cooled to approximately 110 deg. C. In the spray cooler, the gas is further cooled to 60 - 70 deg. C, the desirable temperature level for desulfurization reaction, the necessary amount of ammonia for desulfurization and denitrification is added. The gas then moves into the process vessel, where E-beam is applied to it. In the process vessel, SO<sub>x</sub> and NO<sub>x</sub> are oxidized to become sulfuric acid and nitric acid, respectively, which in turn react with ammonia to produce fine particles of ammonium sulfate and ammonium nitrate, respectively. Some firms in this sector have reported gross margins in the mid-20% to high-30% range.

The global market for desulfurization and denitrification services — which help industries remove sulphur dioxide (SO<sub>2</sub>) and nitrogen oxides (NO<sub>x</sub>) from flue gases and other emissions — is experiencing sustained growth, driven by increasingly stringent environmental regulations, rising industrialisation in emerging economies, and the growing adoption of advanced emission-control technologies. Regionally, the Asia-Pacific region is expected to dominate in terms of demand, largely driven by countries such as China and India, where industrial growth and tighter emission standards are accelerating retrofits and new installations. Meanwhile, North America and Europe remain significant markets albeit with slower growth, given more mature regulatory

frameworks and higher penetration of emission-control systems. Key applications for these services include coal-fired power plants (which contribute a large share of SO<sub>2</sub> and NO<sub>x</sub> emissions), oil & gas refining, cement, steel, chemicals and waste-to-energy plants. The complexity of service offerings ranges from equipment installation (e.g., wet flue gas desulfurization, selective catalytic reduction) to full operation & maintenance contracts, reagent supply, monitoring and by-product management. At this stage, key raw materials and components are sourced, including absorbents (e.g., limestone, lime, activated carbon), reagents (ammonia, urea), catalysts (for selective catalytic reduction (SCR) systems), and structural components (scrubber towers, ductwork, piping). For example, the supply chain for SCR catalysts is sensitive to vanadium-pentoxide and titanium-dioxide based materials, which depend on global mining and refining markets. The end-users of desulfurization and denitrification systems are heavy-industrial sectors such as coal-fired power plants, cement plants, steel mills, waste-to-energy facilities, chemical and petrochemical plants. These facilities purchase or contract for emission-control systems to meet regulatory standards.
