Abstracts

According to our (Global Info Research) latest study, the global Detergent Amylase market size was valued at US\$ 187 million in 2025 and is forecast to a readjusted size of US\$ 263 million by 2032 with a CAGR of 5.0% during review period.

Detergent Amylase is a biocatalyst specifically designed for detergent formulations. It efficiently and gently breaks down starch-based stains (such as rice, noodles, and gravy) adhering to clothing or tableware, converting them into small, water-soluble sugar molecules that are easily rinsed away while preventing soil redeposition during the washing process.

Upstream inputs primarily include fermentation carbon sources, nitrogen sources, inorganic salts, microbial strains, and formulation excipients. Carbon sources are typically derived from glucose, starch sugars, molasses, or corn steep liquor, while nitrogen sources may include soybean meal hydrolysates, yeast powder, or peptone; phosphates, calcium salts, and magnesium salts are added to support microbial growth and maintain enzyme structural stability. The core strains are usually α -amylase-producing microorganisms such as *Bacillus* species suitable for large-scale fermentation. Downstream processing requires stabilizers, carriers, encapsulation materials, granulation aids, preservatives, and liquid protective agents to ensure product shelf-life stability in environments containing high pH levels, surfactants, chelating agents, bleaching agents, or multi-enzyme systems.

In 2025, global sales volume is estimated at approximately 27,000 metric tons. Prevailing ex-factory prices are around US\$3,000-6,000 per ton for liquid products and US\$7,000-12,000 per ton for powder/granule products, with major industry players

achieving gross margins of approximately 30%-45%.
