Abstracts

According to our (Global Info Research) latest study, the global DevOps Automotive Services market size was valued at US\$ 3443 million in 2025 and is forecast to a readjusted size of US\$ 6630 million by 2032 with a CAGR of 9.8% during review period.

DevOps automotive services refer to professional services that help automotive OEMs, Tier 1 suppliers, mobility software developers, and connected vehicle platform operators adopt DevOps, CI/CD, DevSecOps, cloud-native engineering, test automation, software factory, and release management capabilities across vehicle and mobility software lifecycles. These services are used in software-defined vehicle programs, infotainment systems, ADAS/AD platforms, telematics, body electronics, digital cockpit, connected services, and over-the-air update environments, with the goal of improving software development speed, release quality, traceability, compliance, and lifecycle collaboration between in-vehicle and cloud teams. From a value chain perspective, upstream includes cloud infrastructure, DevOps platforms, test automation tools, cybersecurity frameworks, simulation environments, middleware, and engineering talent; midstream involves consulting, architecture design, toolchain integration, pipeline development, automated validation, release orchestration, and managed DevOps operations; downstream demand comes from automotive OEMs, Tier 1 suppliers, EV startups, fleet technology companies, and mobility platform operators. Industry gross margin generally ranges from 24% to 38%, supported by high engineering intensity, compliance-driven delivery, and increasing demand for SDV software lifecycle transformation. Automotive software development is increasingly tied to DevOps, CI/CD, OTA, and software factory models as the industry shifts toward software-defined vehicles.

The market is moving from isolated engineering support toward full software lifecycle

transformation. Automotive customers increasingly want partners that can connect requirements, code, build, test, cybersecurity, compliance, release, and OTA operations into one continuous delivery framework rather than treating them as separate outsourcing tasks.

A major trend is the rise of the software factory model for software-defined vehicles. In this model, CI/CD/CT pipelines, reusable development blueprints, cloud-native toolchains, and automated validation frameworks are used to shorten feedback cycles and improve traceability across globally distributed engineering teams.

Another important direction is the integration of DevOps with automotive safety and cybersecurity requirements. Compared with generic software DevOps, automotive DevOps services increasingly need to align with standards such as ISO 26262, ISO/SAE 21434, and ASPICE, which raises the value of domain-specific consulting, automation, and validation capabilities. This is pushing the market toward DevSecOps and compliance-aware release orchestration.

Cloud-edge collaboration is also becoming more important. As OEMs expand connected vehicle platforms, vehicle data, OTA updates, and remote software operations, DevOps services increasingly cover both in-vehicle software and cloud service layers rather than only embedded code development.

Future growth will continue to be driven by SDV adoption, centralized compute architectures, OTA monetization, automated testing, and the need to reduce vehicle software release cycles while maintaining reliability and regulatory compliance.
