The global Dexterous Hands Tendon Material (UHMWPE Fiber) market size is expected to reach \$ 1213 million by 2032, rising at a market growth of 39.6% CAGR during the forecast period (2026-2032).

Tendon Tissue are a flexible transmission medium that, by mimicking the mechanical principles of human tendons, transmits power from motors located far from the actuators to the joints of a dexterous hand, much like the ligaments of a human hand. Its fundamental difference from traditional rigid transmission systems lies in achieving 'power-actuation' separation: the motors can be centrally located in the forearm, remotely driving finger joints via the tendon ropes, significantly reducing end-effector load. A single tendon rope can drive 3-4 joint bends, requiring only N+1 tendon ropes to drive N degrees of freedom. Tendon ropes are replacing torsion springs and becoming a key material for humanoid robot dexterous hands. Tendon ropes are typically composed of high-strength materials such as steel wire, nylon thread, or ultra-high molecular weight polyethylene (UHMWPE), transmitting force precisely through a series of pulleys and gear systems. Currently, the two main choices for tendon rope drives are high-strength steel wire and ultra-high molecular weight polyethylene fiber (UHMWPE). Ultra-high molecular weight polyethylene fiber (UHMWPE fiber), also known as high-strength, high-modulus polyethylene fiber, typically refers to fibers spun from ultra-high molecular weight polyethylene resin with a molecular weight of 1 million to 5 million. It is currently the fiber with the highest specific strength and specific modulus in the world, possessing numerous excellent properties such as ultra-high strength, ultra-high modulus, low density, wear resistance, low-temperature resistance, UV resistance, anti-shielding properties, good flexibility, high impact energy absorption, and resistance to strong acids, strong alkalis, and chemical corrosion. It is a high-performance tendon material. The specific strength of UHMWPE fiber is more than 15 times that of high-

quality steel, while its density is only 0.97 g/cm³, reducing the total weight of a dexterous hand by 30%-40% and the moment of inertia by 45%, thereby improving gripping speed and dexterity, making it an ideal material for achieving lightweight and high-load transmission.

In 2025, the global production of Dexterous Hands Tendon Material (UHMWPE Fiber) is estimated at approximately 19.49 million units, with an average price of about \$5.8 per unit and a gross margin of about 35%.

Case Studies: The earliest commercially available dexterous hand using chords can be traced back to 2004, when the British company Shadow launched the first chord-driven five-finger dexterous hand, Shadow. Subsequent models like the Shadow Hand Plus and Lite series also utilize chord drive systems.

The Norwegian robotics company 1X's Neo Gamma home robot, launched in early 2025, extensively utilizes chords in its drive system.

Tesla's Optimus third-generation dexterous hand, the Linker Hand L30 research version, and the DexHand 021/DexHand021 Pro all employ chord drive systems.

With the rapid advancement of intelligent manufacturing, flexible automation, and the industrialization of humanoid robots, robot tendon chords, as lightweight, flexible, and efficient transmission components, have gradually become an important part of robot drive systems. Ultra-high molecular weight polyethylene (UHMWPE) fiber, with its high specific strength, low density, excellent fatigue life, and superior wear resistance, has become an ideal material for achieving high degrees of freedom, precision operations, and long-term stable operation. This trend is particularly evident in applications such as dexterous hands, multi-degree-of-freedom joints, and flexible arms, driving the continued growth in demand for UHMWPE robot tendon chords. With leading companies like Tesla and KUKA planning to mass-produce humanoid robots and the increasing demand for flexible transmission solutions in high-end industrial applications, the robot tendon chord market is experiencing significant expansion. Despite the broad market prospects, the UHMWPE robot tendon chord industry also faces several challenges. First, the high barriers to entry in the preparation process and precision processing of UHMWPE fibers lead to a heavy reliance on a few global material suppliers for high-end products, resulting in a structural shortage of high-end supply both domestically and internationally. Second, downstream robot companies impose stringent requirements on product consistency, durability, and repeatability, making standardization and quality control of tendon chord technology a key bottleneck for

industry development. Furthermore, fluctuations in raw material prices, rising production costs, and supply chain instability may also affect a company's gross profit margin and market expansion speed. On the downstream demand side, the application of robotic tendons is expanding from traditional industrial machinery to higher value-added humanoid robots, service robots, and medical rehabilitation robots. Particularly in dexterous hands and multi-degree-of-freedom actuated joints, UHMWPE tendons can significantly improve the sensitivity, flexibility, and precision of robot movements, providing broader application scenarios for robots in areas such as precision assembly, grasping complex-shaped objects, and human-robot collaboration. With technological maturity and cost reduction, the penetration rate of robotic tendons is expected to accelerate, driving continued expansion of the overall market.
