## Abstracts

Diabetic retinopathy is a disorder of the eye that damages the blood vessels of the retina. The retina is the light-sensitive inner surface of the eye on which images are formed. Long-term diabetes affects the retina as high blood glucose levels can damage the tiny blood vessels in the retina. Diabetic retinopathy is broadly classified into non-proliferative diabetic retinopathy and proliferative retinopathy. Treatment for diabetic retinopathy depends on the stage of the disease and is directed toward slowing down or stopping the progression of the disease.

According to our (Global Info Research) latest study, the global Diabetic Retinopathy market size was valued at USD 7983.2 million in 2022 and is forecast to a readjusted size of USD 11960 million by 2029 with a CAGR of 5.9% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Laser surgery, injection of corticosteroids or anti-VEGF drugs into the eye, and vitrectomy are some of the available treatments. One feature of diabetic retinopathy is diabetic macular edema. This is a serious medical condition involving leakage of fluid from the minute, delicate, and previously injured blood vessels located at the back of the eye, which then collects in the macula. This results in inflammation of tissue and blurry vision.
