Abstracts

According to our (Global Info Research) latest study, the global Diallyl Carbonate (DAC) market size was valued at US\$ 11.97 million in 2025 and is forecast to a readjusted size of US\$ 17.24 million by 2032 with a CAGR of 5.3% during review period.

Diallyl carbonate (DAC) is an organic carbonate monomer containing two allyl reactive functional groups, with a molecular structure that combines carbonate groups and polymerizable double bonds. It is typically a colorless to pale yellow transparent liquid, CAS No. 15022-08-9? This product can form a three-dimensional network structure through free radical polymerization, copolymerization, or cross-linking reactions, and has good transparency, heat resistance, chemical resistance, insulation, and dimensional stability. It is mainly used as a crosslinking monomer for thermosetting resins, optical resin raw materials, electronic packaging material modifiers, reactive components for coatings and adhesives, as well as special polymers and organic synthesis intermediates. Compared with general carbonate solvents, DAC is more inclined towards functional monomers, and its value is mainly reflected in the improvement of reaction activity and polymer properties, rather than being used as a general solvent. Diallyl Carbonate (DAC) is commonly used as a monomer in the production of special polymers and is a raw material for the production of diethylene glycol diallyl carbonate.

In 2025, global Diallyl Carbonate (DAC) production reached approximately 794 Tons, with an average global market price of around US\$ 14.65 per Kg. The annual production capacity of diallyl carbonate is 1,100 tons, with a gross profit margin of about 30%.

The upstream mainly includes basic chemical raw materials such as dimethyl

carbonate, allyl alcohol, catalysts, and polymerization inhibitors,

The downstream is mainly used as a monomer for producing special polymers, which is the raw material for producing diethylene glycol diallyl carbonate.

Raw material costs account for 70%; Labor costs account for 10%; The manufacturing cost accounts for 20% of the total cost.

Diallyl carbonate is a special fine chemical with a small supply scale and strong application specialization. Currently, the market demand is mainly concentrated in the fields of optical resins, etc. Downstream customers usually pay more attention to purity, moisture, metal ions, color, inhibitor content, and batch stability. Therefore, the product certification cycle is longer, and stable supply capacity and quality control level are more important than simply expanding production capacity. With the increasing demand for miniaturization of electronic components, high-density packaging, high-temperature insulation materials, and highly transparent polymers, the application of DAC in electronic and optical materials has certain room for expansion. At the same time, the substitution of low volatility reactive monomers for traditional high volatility organic components also constitutes a potential growth momentum.
