According to our (Global Info Research) latest study, the global Diamond Heat Spreaders market size was valued at USD 122.3 million in 2023 and is forecast to a readjusted size of USD 206.3 million by 2030 with a CAGR of 7.8% during review period.

A heat spreader transfers energy as heat from a hotter source to a colder heat sink or heat exchanger. There are two thermodynamic types, passive and active. The commonest sort of passive heat spreader is a plate or block of material having high thermal conductivity, such as copper, aluminum, or diamond. An active heat spreader speeds up heat transfer with expenditure of energy as work supplied by an external source.

Diamond heat spreaders can reduce thermal management bottlenecks and achieve lower operating temperatures, improved performance and extended system life in a range of electronics applications.

The consumption area of Diamond Heat Spreaders is mainly concentrated in North America and Europe, and the two regions are accounting for about 35% and 30% of total consumption respectively.

At present, major global manufacturers include Element Six, Smiths Interconnect, ALMT Corp, etc. These three major manufacturers account for over 50% of the world's total share.

It can be divided into three types: 1000-1500 W/m.K, 1500-2000 W/m.K, and others.
