Abstracts

The global Diamond-Like-Carbon Film Coatings market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Diamond-Like-Carbon Film Coatings are formed when ionized and decomposed carbon or hydrocarbon species fall on the surface of a substrate with energies typically in the range of 10-300eV. DLC films may have special mechanical (high hardness), optical (high optical bandgap), electrical (high resistivity), chemical (inert) and tribological (low friction and wear coefficients) properties that can be used at low substrate temperatures (~200°C). Diamond-like carbon (DLC) coatings can be deposited by different techniques such as PVD arc, PVD sputtering and PACVD processes. The choice of technique and deposition parameters allows for a wide variety of performance characteristics, including hydrogenated and non-hydrogenated DLC coatings.

This report studies the global Diamond-Like-Carbon Film Coatings production, demand, key manufacturers, and key regions.
