## Abstracts

The global Dicalcium Phosphate (DCP) for Tooth-Paste market size is expected to reach \$ 145 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

Calcium hydrogen phosphate for toothpaste refers to dicalcium phosphate materials that meet the requirements of friction and polishing agents for toothpaste. It mainly includes two types: calcium hydrogen phosphate dihydrate and anhydrous calcium hydrogen phosphate. It is used to provide gentle cleaning, remove dental plaque and surface stains, and improve polishing effect during brushing. At the same time, it has stricter control requirements for taste, whiteness, particle size distribution, wear value, and impurity safety indicators. In 2025, global Dicalcium Phosphate (DCP) for Tooth-Paste production reached approximately 56.37 K MT, with an average global market price of around US\$ 1,753 per MT.

Calcium hydrogen phosphate for toothpaste belongs to a mature and stable functional filler track, with demand coming from rigid consumption of daily chemical oral care. The overall growth is more related to population size, brand structure upgrading, and emerging market penetration, rather than rapid expansion. The focus of competition is shifting from simple price to standardization and consistency capabilities. High end brands are more concerned with low metal impurities, low soluble salt residues, controllable particle size and morphology, stable whiteness, and predictable wear values, thereby reducing formula fluctuations and quality complaints. Therefore, suppliers with stable process control and a complete compliance document system are more likely to enter the long-term supply chain of top toothpaste companies and obtain certain premiums. At the same time, the increasing proportion of whitening and stain removal products has brought about a demand for higher polishing efficiency and complex friction systems, making structural opportunities for waterless or complex grades more prominent. However, it also puts higher requirements on the wear safety

boundary, promoting suppliers to continue investing in particle engineering, surface treatment, and batch consistency.
