Abstracts

The global Die Attach Adhesive market size is expected to reach $ 1093 million by 2032, rising at a market growth of 8.2% CAGR during the forecast period (2026-2032).

Die attach adhesives are used to attach semiconductor chips to packaging substrates. In addition to forming the attachment, they can help mitigate stress and control warpage during system operation. Some die attach adhesives are formulated to be both thermally conductive and electrically insulating. In 2025, global Die Attach Material sales reached approximately 6,073.1 MT, with a weighted average price of 85,913 US$/MT.

Growth in the Die Attach Material market is being driven by rising semiconductor output, increasing die counts per electronic system, higher package power density, and more demanding thermal-management requirements. AI accelerators, data-center processors and high-performance computing devices require low-void and thermally conductive bond lines, while SiC and GaN power semiconductors used in electric vehicles, charging infrastructure, renewable-energy inverters and industrial drives are accelerating the transition from conventional resin adhesives and solder joints toward silver or copper sintering materials capable of withstanding higher junction temperatures and repeated thermal cycling. Mini LED, Micro LED, RF and optoelectronic packaging also require finer metal particles, tighter rheology control and higher dispensing or printing accuracy. At the same time, automotive reliability requirements and customer pressure to reduce lead, halogens and PFAS are encouraging suppliers to develop lower-modulus, lead-free, zero-halogen and PFAS-free formulations.
