Abstracts

Die casting is a method of metal fabrication in which the manufacturers press a piece of molten metal into a mold designed to produce the desired shape. Die casting uses two main components: a die and a cavity. The die is made from steel, aluminum, or other alloy and has a series of holes and channels machined into it to form the object that will be cast. The molten metal flows into these cavities, thus forming the part you want to produce from your raw materials.

Automotive die casting uses a metal molding process to produce parts from molten metal (die). They then cool the metal and solidify it into parts such as engine blocks or gearboxes machined into shape. This process reduces waste and saves time and costs for manufacturers and customers.
