According to our (Global Info Research) latest study, the global Diesel Particulate Filter (DPF) Cleaning Agent market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Diesel Particulate Filter (DPF) Cleaning Agent refers to a chemical solution that is designed to remove the buildup of soot and impurities from a diesel particulate filter used in vehicles. DPFs are typically used in modern diesel engines to reduce emissions and comply with environmental regulations. Over time, the filter can become clogged with soot and other contaminants, leading to reduced engine performance and increased emissions. The cleaning agent is a specialized solution that is introduced to the DPF through the engine's injection system. It works by breaking down the accumulated soot and impurities, converting them into a liquid form that can be easily drained or filtered out of the system. The cleaning process typically takes between 30 minutes to one hour, depending on the level of buildup inside the filter. DPF cleaning agents can be used as part of a regular maintenance routine to keep the filter functioning at optimal levels. Regular cleaning can help increase engine performance, reduce emissions, and extend the lifespan of the DPF. It can also prevent costly repairs and replacements down the line.
