According to our (Global Info Research) latest study, the global Differential Amplifier and ADC Driver market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

The differential amplifier is a circuit device used to amplify the differential portion of an input signal. The ADC driver refers to a circuit or device used to drive an analog-to-digital converter. Differential amplifiers and ADC drivers play important roles in signal processing systems.

The differential amplifier collects the voltage difference between the two input ports and amplifies it for output. It has the characteristics of suppressing common-mode interference, enhancing signal transmission and improving system performance. The ADC driver can provide input signals and has the characteristics of amplitude adjustment, driving capability, and anti-interference. Differential amplifiers and ADC drivers are used in combination to achieve high-quality analog signal conversion and acquisition.
