According to our (Global Info Research) latest study, the global Differential Pressure Controller market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A differential pressure controller is a device used to monitor and control the differential pressure of a liquid or gas in a system. It usually consists of sensors, control modules and actuators to maintain the differential pressure between two points in the system within a set range.

The differential pressure controller includes: the sensor measures the differential pressure, the control module processes the signal, the controller adjusts the actuator, and maintains the differential pressure within the set range. By using the differential pressure controller, the precise control and adjustment of the differential pressure in the system can be realized, thereby improving the stability, efficiency and reliability of the system.
