A differential pressure Transducer is a device which can sense the difference in the pressure between the particular terminals of a device, to which it is connected. Also, it is often used for the purpose of converting pressure into a signal of an analog electrical signal. It is a common but a very important and useful pressure measuring device in industrial instrumentation and control devices. A differential transducer is also known as a differential transmitter. There are various types of a differential pressure transducer, among which, the most commonly used differential pressure transducer is strain-gauge Wheatstone bridge pressure transducer.

The activity of measuring the pressure of various device and machinery used in various industry is the most typical and critical process parameter. Therefore, increasing automation in almost every process industries is driving the market of a differential pressure transducer, so as to optimize the cost and resources of the process, which can improve the revenue and safety.
