According to our (Global Info Research) latest study, the global Differential Receiver market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

A differential receiver is a receiver commonly used in communication systems to receive and demodulate differential signals. The differential signal is composed of two independent signals with the same characteristics, and the differential receiver can effectively suppress common mode noise and have stronger anti-interference ability.

The input of the differential receiver is a differential signal, and the circuit structure can effectively suppress common-mode noise and demodulate the differential signal. The advantages of differential receivers: strong anti-interference, improved signal integrity, reduced bit error rate, suitable for high frequency signals. The differential receiver improves the anti-interference ability and reliability of the signal through differential input and common-mode noise suppression characteristics, and is suitable for the reception and demodulation of various high-frequency signals.
