Abstracts

According to our (Global Info Research) latest study, the global Digital Cutting Services market size was valued at US\$ 539 million in 2025 and is forecast to a readjusted size of US\$ 851 million by 2032 with a CAGR of 6.7% during review period.

Digital cutting services refer to manufacturing services provided by professional processing service providers or online manufacturing platforms. Based on engineering drawings, CAD files, vector files, or 3D models submitted by clients, these services utilize digitally controlled processes such as CNC laser cutting, digital blade cutting, vibratory blade cutting, waterjet cutting, CNC router, digital die-cutting, half-cutting, creasing, scribing, drilling, and grooving to perform customized cutting, prototyping, small-batch production, or mass production of materials including metals, plastics, rubber, foam, cardboard, textiles, wood, acrylic, tape, composite materials, and other sheets or rolls.

From a product roadmap perspective, laser cutting remains the mainstream digital cutting process for metals, acrylics, wood, and thin sheet materials; digital blades and vibrating blades are more suitable for foam, rubber, composite materials, cardboard, textiles, tapes, and heat-sensitive materials; waterjet cutting has advantages in carbon fiber, G10, thick plates, heat-affected materials, and special engineering materials; routers and digital die-cutting retain value in packaging, signage, wood-based panels, foam, and thick material scenarios. Future competition will depend not only on the capabilities of individual machines, but also on digital pricing systems, material databases, automatic layout, process parameter management, order fulfillment networks, and quality consistency. The industry will not be completely replaced by 3D printing in the short term, as many sheet, plate, and roll parts are still better suited to

subtractive cutting in terms of cost, material properties, surface quality, and production efficiency.
