Abstracts

The global Digital Imaging Plate market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

A digital imaging plate (DIP) is a flat, flat panel used in digital radiography to capture X-ray images. It consists of a sensor array that converts X-ray photons into digital signals, which are then processed to create an image. Unlike traditional film X-rays, DIPs do not require chemical processing and allow for immediate image capture and review, making them more efficient and environmentally friendly. They are used in various medical, dental, and veterinary fields for capturing X-ray images of different body parts.
