Abstracts

According to our (Global Info Research) latest study, the global Digital Induction Heating Equipment market size was valued at US\$ 345 million in 2024 and is forecast to a readjusted size of USD 888 million by 2031 with a CAGR of 14.5% during review period.

Digital induction heating equipment is a device that uses the principle of electromagnetic induction to heat metal or other conductive materials, and achieves precise temperature control, timing and parameter adjustment through a digital control system. It uses digital signal processing and automatic control technology to combine traditional induction heating equipment with modern digital technology to achieve an efficient, accurate, energy-saving and safe heating process. This type of equipment mainly generates an alternating magnetic field in the heating coil through high-frequency alternating current, and then generates eddy currents in the workpiece to be heated, causing the material to heat up rapidly. At the same time, the control system will monitor the temperature and other parameters in real time to ensure the heating quality and process stability.
