Abstracts

The global Digital Insurance Brokerage Service market size is expected to reach \$ 54887 million by 2032, rising at a market growth of 13.8% CAGR during the forecast period (2026-2032).

Digital insurance brokerage services refer to a digital insurance intermediary model in which brokerage firms leverage internet platforms, big data, artificial intelligence, cloud computing, mobile applications, and online operational systems to provide services such as product price comparison, risk assessment, solution design, online policy purchasing, policy management, renewal reminders, claims assistance, customer engagement, and risk management to corporate or individual clients. Unlike traditional insurance brokerage which relies heavily on offline consultants, manual sales efforts, and paper-based processes, digital insurance brokerage emphasizes online customer acquisition, intelligent matching, automated underwriting, electronic policies, data-driven operations, and a closed-loop service process. This model enhances the efficiency of insurance product outreach, reduces sales and service costs, and offers clients more transparent, convenient, and personalized insurance solutions; it is primarily applied in sectors such as health insurance, auto insurance, property insurance, liability insurance, employer's liability insurance, group insurance, corporate risk management, and internet-scenario-based insurance.

The upstream segment of the digital insurance brokerage service industry chain comprises resources such as insurance companies and their products, reinsurers, risk control data, medical and health data, vehicle and business operational data, credit and anti-fraud data, payment gateways, electronic signatures, cloud computing, AI algorithms, customer service systems, CRM, policy management systems, claims systems, and compliance/regulatory interfaces. The midstream consists of digital

insurance brokerage service providers who utilize online platforms, mini-programs, mobile apps, enterprise service systems, or SaaS tools to offer services?including price comparison, risk assessment, intelligent recommendations, online purchasing, electronic policies, renewal reminders, claims assistance, customer engagement, and risk management?to individual and corporate clients; their revenue is primarily derived from insurance commissions, service fees, corporate risk management fees, and platform technology service fees. Downstream clients include individual consumers, SMEs, platform-based enterprises, employer groups, internet-scenario clients, logistics and mobility companies, healthcare institutions, and financial institutions; their core needs are to reduce insurance procurement costs, improve the efficiency of purchasing and claims processing, and obtain more transparent and personalized insurance solutions. Digital insurance brokerage services account for approximately 51%.

The core value of digital insurance brokerage services lies in enhancing the efficiency of insurance matching and increasing service transparency. Traditional insurance brokerages rely on offline consultants, manual communication, and channel resources, making it difficult for customers to quickly compare product differences, coverage scopes, and pricing across various insurance companies. Digital brokerages leverage online platforms, intelligent questionnaires, risk profiling, product comparison tools, and automated recommendations to rapidly match customer needs with insurance products, thereby reducing information asymmetry. For individual customers, these platforms enhance the convenience of purchasing products such as health, accident, and auto insurance; for corporate clients, they improve the efficiency of structuring insurance solutions?including group insurance, employer's liability insurance, property insurance, and cyber insurance.

Industry competition is shifting from merely 'selling insurance online' to providing 'data-driven risk management services.' Early digital brokerages relied heavily on internet traffic and online conversions, with business models centered on sales commissions; however, rising customer acquisition costs, stricter regulations, and maturing customer needs are putting profit pressure on the simple 'sales-only' model. Future competitive digital brokerage service providers will leverage customer data, industry-specific risks, claims history, health management, business operational contexts, and compliance requirements to offer services such as risk assessment, solution design, renewal management, claims assistance, and risk prevention advice. In essence, digital brokerages will evolve beyond mere 'insurance product distribution platforms' into comprehensive service providers integrating insurance structuring, risk management, and customer lifecycle management.

While digital insurance brokerage services offer significant growth potential, compliance and trust remain critical long-term hurdles. Insurance products involve long-term protection and financial security; while digitalization boosts efficiency, it can also lead to issues such as misleading sales, aggressive marketing, inadequate information disclosure, data privacy concerns, and inconsistent claims experiences. Consequently, the industry must look beyond online conversion rates and prioritize product suitability, sales compliance, customer education, data security, and after-sales service capabilities. Leading enterprises will distinguish themselves through licensing qualifications, partnerships with insurers, actuarial and risk management expertise, technological platform capabilities, claims service quality, and long-term customer retention rates. Conversely, small and medium-sized platforms that rely solely on traffic and commissions risk being squeezed out by large insurance groups, internet platforms, and specialized corporate risk management firms.
