According to our (Global Info Research) latest study, the global Digital Metal Detector market size was valued at USD 679.3 million in 2023 and is forecast to a readjusted size of USD 1145.6 million by 2030 with a CAGR of 7.8% during review period.

A digital metal detector is an electronic instrument that detects the presence of metal nearby. Metal detectors are useful for finding metal inclusions hidden within objects, or metal objects buried underground. They often consist of a handheld unit with a sensor probe which can be swept over the ground or other objects. If the sensor comes near a piece of metal this is indicated by a changing tone in earphones, or a needle moving on an indicator. Usually the device gives some indication of distance; the closer the metal is, the higher the tone in the earphone or the higher the needle goes.
