According to our (Global Info Research) latest study, the global Digital Microwave Communication market size was valued at US\$ 2315 million in 2024 and is forecast to a readjusted size of USD 3257 million by 2031 with a CAGR of 5.0% during review period.

Digital microwave communication refers to the transmission of digital signals over microwave frequencies, typically used for point-to-point communication links in telecommunications, broadcasting, and data networking. It involves using microwave radio waves (typically in the frequency range of 1 GHz to 100 GHz) to carry data, voice, or video signals between two fixed locations. This technology is widely used for wireless backhaul in mobile networks, satellite communication, and high-speed internet connections, offering high capacity, low latency, and reliability over long distances. Digital microwave communication systems convert data into digital format, modulate it onto microwave signals, and transmit it through line-of-sight (LOS) links. It is especially valuable in areas where laying physical cables is impractical or too expensive.
