Abstracts

According to our (Global Info Research) latest study, the global Digital Night Vision Cameras market size was valued at US$ 3417 million in 2025 and is forecast to a readjusted size of US$ 4877 million by 2032 with a CAGR of 5.3% during review period.

Night vision cameras often use infrared, because low light imaging used by night vision cameras is not clear enough and cannot provide long-distance detecting in total darkness at night, but infrared cameras can. The biggest advantage of infrared cameras is that it is much better at spotting and tracing objects. Visible light devices and night vision cameras with low light imaging cannot see the target hidden in the grass or forest. However, with infrared cameras, the infrared radiation of the targets which stands for heat would go through the covering material and can be clearly seen.
