According to our (Global Info Research) latest study, the global Digital PCOS Management market size was valued at US\$ 767 million in 2025 and is forecast to a readjusted size of US\$ 1352 million by 2032 with a CAGR of 8.4% during review period.

Digital PCOS Management refers to a digital healthcare service system that utilizes artificial intelligence (AI), big data, mobile health applications, wearable devices, telemedicine, and health management platforms to provide long-term, personalized, and comprehensive care for patients with Polycystic Ovary Syndrome (PCOS). Addressing common PCOS-related issues?such as ovulatory dysfunction, hyperandrogenism, insulin resistance, obesity, menstrual irregularities, and fertility needs?the system collects data on menstrual cycles, weight, BMI, blood glucose, insulin, hormone levels, exercise, diet, and sleep. By integrating AI algorithms, it offers risk assessment, lifestyle interventions, nutritional management, exercise guidance, fertility health management, medication support, and remote physician follow-ups. Digital PCOS management enables early disease detection, long-term behavioral improvement, and reduced risk of complications, representing a key application area in the digital management of women's health.

The sector is currently driven by the rising prevalence of PCOS, the growth of FemTech, increasing demand for assisted reproductive services, the need for obesity and metabolic disease management, and the widespread adoption of telemedicine; the industry is evolving from simple menstrual tracking tools into comprehensive women's health management platforms. Key opportunities lie in AI-driven menstrual cycle and ovulation prediction, fertility support management, insulin resistance management, weight and nutrition interventions, mental health support, remote gynecological

consultations, and integration with smart wearable devices. Core competitiveness is defined by capabilities in women's health data analysis, AI predictive modeling, gynecological and endocrinological medical knowledge, long-term user engagement, physician resource integration, and health ecosystem development. Current industry challenges include the complex presentation of PCOS symptoms, lengthy diagnostic processes, poor long-term patient adherence, limited frequency of hormone and metabolic data collection, fragmented medical data, difficulties in formulating personalized treatment plans, and a lack of medical standardization in online services. Solutions involve establishing multidimensional health data platforms, introducing AI-assisted risk identification, enabling continuous monitoring through menstrual tracking, smart devices, and home testing, creating comprehensive intervention plans that combine nutrition, exercise, medication, and fertility management, and strengthening the integration of online and offline medical services. Overall, digital PCOS management is evolving toward a long-term management model characterized by "women's health data + AI prediction + lifestyle intervention + medical collaboration."
