Abstracts

The global Digital PET-CT Scanner market size is expected to reach \$ 3801 million by 2029, rising at a market growth of 13.5% CAGR during the forecast period (2023-2029).

A Digital PET-CT scanner is a medical imaging device that combines the functional imaging capabilities of a Positron Emission Tomography (PET) scanner with the anatomical imaging capabilities of a Computed Tomography (CT) scanner. The scanner is used to generate images of the body that can help in the diagnosis and treatment of various diseases, including cancer, heart disease, and neurological disorders. Unlike traditional PET scanners, which use analog photomultiplier tubes to detect gamma rays emitted from a patient's body, digital PET scanners use silicon photomultiplier detectors, which offer higher sensitivity and resolution. This allows for more precise localization of the radioactive tracer used in PET imaging, which in turn allows for more accurate detection and diagnosis of diseases.

This report studies the global Digital PET-CT Scanner production, demand, key manufacturers, and key regions.
