Abstracts

According to our (Global Info Research) latest study, the global Digital Telemetry (TMS) Torque Sensors market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Digital Telemetry (TMS) Torque Sensors feature a non-contact digital telemetry design that enhances data acquisition integrity by increasing resolution and eliminating mechanical interference; thus providing a more accurate indication of actual torque. Friction (contact) is completely eliminated and maintenance requirements are reduced. There are no touch points in the digital telemetry system. The whole system is composed of transceiver module, coupling module and signal processing module. The transmitter module is integrated in the torque sensor and amplifies, digitizes and modulates the RF carrier signal from the sensor, which is received by the caliper coupling module (receiver). The digital measurement data is then recovered by the signal processing module.
