The global Digital Twin Supply Chain market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Digital twin supply chain refers to a type of supply chain management system that uses digital twin technology to optimize and improve the efficiency of supply chain operations. Digital twin technology involves creating a virtual replica of a physical system or process, which can be used to simulate and analyze different scenarios and predict outcomes. In the context of supply chain management, a digital twin can be created to represent the entire supply chain, including suppliers, manufacturers, distributors, and customers. The digital twin can be used to model different scenarios, such as changes in demand or disruptions in the supply chain, and determine the most efficient and cost-effective way to respond. This technology can also be used to monitor and analyze real-time data from the supply chain, enabling companies to identify bottlenecks, reduce waste, and improve overall performance. The digital twin supply chain is a key component of Industry 4.0, which is the trend toward automation and data exchange in manufacturing and other industries.
