To address the core issues of traditional vision therapy methods, such as their limited scope, low patient compliance, difficulty in quantifying and tracking rehabilitation data, and challenges in implementing personalized treatment plans, digital vision therapy solutions have emerged. Since the beginning of the 21st century, with the deep application of digital interactive technologies, artificial intelligence algorithms, and wearable devices in the healthcare field, this field has achieved a leapfrog development from concept to clinical practice. Currently, digital vision therapy solutions have evolved into intelligent systems integrating visual function assessment, personalized therapeutic games and task design, real-time biofeedback, remote monitoring, and dynamic adjustment. They are widely used in areas such as amblyopia and strabismus rehabilitation in children, visual function training in adults, visual rehabilitation after brain injury, and improving visual performance in working professionals. These solutions significantly enhance the enjoyment and engagement of treatment, achieve precise quantitative treatment, and optimize rehabilitation effects and efficiency—a modern healthcare service solution.
